Not for you? Not a problem!

Simply toggle back to paper statements.

Smart water use

Did you know that a running toilet can waste up to 200 gallons of water a day?! Leaks are sneaky and can waste a whole lot of water over a short period of time, adding up to a lot of wasted money.

Below are some fixes to common leaks around the house. If these simple fixes do not work, or you are not comfortable fixing them yourself, call a trusted handyman or licensed plumber to get the job done.

Faucets

The Test: Turn the faucet on then all the way off. If it's still dripping or running, there could be a leak.

Possible Solution: Worn out faucet washers and gaskets frequently cause leaks. Head to your local hardware store. Ask them how to safely change washers. Remember to turn off the water first.

Showerheads

The Test: Turn the faucet on then all the way off. If it's still dripping or running, there could be a leak. Mineral build up on the outside of the faucet could also indicate a leak.

Possible Solution: Make sure there is a tight connection between the pipe stem and showerhead by using pipe tape to secure it. For more complicated valve leaks that drip when the water is turned off, contact a handyman or plumber.

Toilets

The Test: Place a drop of food coloring in the toilet tank. Wait 15 minutes. If there's color in the toilet bowl, you have a leak. Remember to flush immediately after the test to avoid dyeing your toilet.

Possible Solution: A common reason for a leak is an old or worn out toilet flapper, or "valve seal." Visit your local hardware store for a new flapper to fix this leak.
